It was developed using object oriented programming techniques. There are so many different kinds of objects (block, plot, tag, text, annotations, etc) that make up AutoCAD drawings and documents, each of them having different characteristics and behaviours. Objects in AutoCAD may be categorized into groups called "libraries". Any object in AutoCAD has a code that determines its position on the screen, the size of the object, and its relative position and movement with respect to other objects. This code is called the object's "tag". The most important part of AutoCAD, however, is the "data tag". The data tag is what provides the drawing commands to the computer. Using the data tag, the AutoCAD user (CAD operator) can specify the type of object, the tools and how they should work, and how the drawing should be created. The data tag is defined in the source code. The Autodesk Autocad source code for various platforms is available here.
