I have a script that has a while True: loop. I use the module traceback to generate a traceback for the last few lines of code, and to then provide some useful information to the user. But I do not want to include the "while True:" line in the traceback. If the program ends due to an exception, or just gets killed by CTRL+C, I want to not show the "while True:" line in the traceback. But as the line is not actually executed by the python interpreter, I have to use an if else statement: if \_\_name\_\_ == '\_\_main\_\_': while True: # code else: traceback.print\_exc(None, file=sys.stderr) Is there a more elegant way to do this? Something similar to how we could use this: sys.exit(error) But without exiting Python? A: The exception is usually raised during the running of the main function. You can raise an exception at that line and not get a traceback. A: Use sys.exc\_clear() to clear the exception and also restore the Python exit code. A: The traceback module in the standard library (which is what you were using) is specifically designed
