Before AutoCAD, CAD (computer-aided design) programs had been available but had limitations. In 1980, Walter Pettes and John Rand, members of a team of researchers at the University of California at Berkeley, created the first widely used commercial CAD system. They created several standalone CAD programs, which are now referred to as "Newspaper Tracer" (or just "NTrace") and "Print Shop". NTrace was the first CAD application to allow a user to collaborate with other CAD users in real-time. The first version of NTrace was distributed in 1978. The first version of Print Shop was released in 1981. The developers of NTrace and Print Shop had the idea of CAD combined with structured-document processing. The development of AutoCAD started after two years of development, on April 24, 1982. By the end of 1982, a version of NTrace was also released. Although AutoCAD and NTrace competed with one another, neither became dominant, since AutoCAD has more functions and better functionality. With the release of AutoCAD, a new class of CAD applications emerged that integrated CAD with other applications. CAD applications now have the ability to create new data types, such as curves, B-splines, and parametric surfaces. These applications include spreadsheet applications, word processors, and presentations applications. AutoCAD, which is the first CAD program to enable integrated design, was released in 1985. AutoCAD became the most widely used CAD software in the world in 1995. By 1997, AutoCAD had a total of over 1.8 million users, and had the highest market share of the computer-aided design market. In August 1997, it was reported that there were 2 million AutoCAD users, and that the company had earned \$1.7 billion, after the purchase of Carrara by Autodesk. When Autodesk was bought by The Carlyle Group in August 2004, the company was valued at more than \$4.8 billion. In 2007, Autodesk received the IEEE Software Award for "Outstanding Achievement in Service" for its contributions to the field of CAD. History In December 1981, Walter Pettes, John Rand, and David Slutzki worked on a design document in NTrace. They used NTrace to draw and edit simple geometric shapes, such as circles, rectangles,

Treatment of complex atrophic condylar process deformities of the temporomandibular joint. The treatment of atrophic condylar process deformities of the temporomandibular joint is controversial. A retrospective study was performed to compare the results of early surgical intervention with the results of conservative treatment in 30 patients with atrophic condylar process deformities who underwent orthognathic surgery. Based on the degree of atrophic process, the temporomandibular joint was classified into three groups, namely, no condylar atrophy (group I), mild to moderate condylar atrophy (group II), and severe condylar atrophy (group III). The joint spaces were classified as widened, narrowed, or normal. The results of this study showed that there was a significant improvement in both the joint spaces and mouth opening in all three groups after surgery. Group II, which had a wider joint space, showed the best response to surgery. Patients with unilateral narrowing of the joint space were treated equally well on both sides, whereas patients with bilateral narrowing showed less improvement. The results of this study support early surgical intervention in patients with no condylar atrophy. The decision to treat these patients conservatively is made individually, depending on the patient's symptoms.import React, { Component } from 'react'; import { Button, Card, CardHeader, CardTitle, Link, Grid } from '@alifd/next'; import styles from './index.module.scss'; const rowStyle = { backgroundColor: '#f7f7f7', margin: '10px 0', padding: '10px' }; const url = { home: '/', login: '/login', logout: '/logout', register: '/register' }; const Loading = () => { return (Loading...
