Keymacro is a program for Windows XP/Vista/7/8 which has the ability to send modifier keys with special commands. It's designed to reduce the time you need to press several keys on your keyboard. If you are typing a lot in word processors, and then some special word, you may want to use the modifier keys (Shift, Ctrl, Alt) by pressing them just one time, and then typing the word you're interested in. But that can be a pain, isn't it? I'm sure you don't want to take your hands off the keyboard while typing a word, then press the modifier keys, and then move them back to the keyboard. This is the thing that Keymacro helps you to do. It allows you to press the modifier keys once, and then press the special word key. This means that you just have to do two keystrokes, instead of several. It's possible to define what key and what modifier are used to type a word. This is one of the main advantages of the program. The keyboard can be redefined, so that you can type the word you want, no matter of your keyboard layout. For example, the word "cookie" in English can be typed by pressing Ctrl and the letter "c" on the keyboard. Then you just have to move the cursor to the beginning of the word, and press the word key. Keymacro is a free program, and it's available in the internet for downloading.
