Direct transplantation of hepatocytes into the liver of rats has not been successful as a means of obtaining functionally active liver cells. A similar approach has been attempted with hepatocytes grafted to the kidney capsule and for the first time in this study, such cells survived and persisted within the kidney. At 6 months posttransplantation, transplanted hepatocytes were present in the renal capsule in numbers averaging 8.3×10^4 /capsule (approximately 20% of the total kidney cell population). Erythrocytes, of which the transplanted hepatocytes had been stained at the time of transplantation, were rarely seen in the renal capsule. Hepatocytes that had survived in the kidney did not express albumin, but did synthesize
