Use the Convert to BeerXML button and navigate to where you wish to save the BeerXML file (Default is C:\ConvertedBeerRecipes). Other Details: BeerXML is an open format created in 2005 as an alternative to the proprietary Promash format by David Loudermilk. It is a simple XML-based format and is a much better solution than Promash. The initial creators released it freely and have released source code and an API. BeerXML is a 100% open format and is free to use, though it has associated costs for a server license to host the data. BrewCraft is a leading beer company. They created this software because they thought Promash was not open enough, so the format needed to be open and they came up with BeerXML. There is no affiliation, or intention to compete with Promash. This software was created in an effort to make the Promash format more compatible between the different software packages. Since the format is a free format the authors would like to encourage the open sharing of BeerXML. What's New In Promash File Converter?

Promash File Converter (Promash) is a tiny utility that allows you to import and export Promash recipes and their most primitive data from/to both Text and Windows Binary files. It can be used as a stand-alone application or as a small part of a larger application. It is written in C# but the source code is not required to use this software. It was written for Personal use and not to be sold commercially. The software is Open Source and may not be used or distributed commercially. It is released under the GNU General Public License Version 2.0. *The software was created on September 04th, 2011 for an unnamed client who told me that the only way to get their hands on the (unnamed) software was for me to make it available on the internet. I agreed to do so but I can't or won't name them. If you know the client, you are welcome to use and modify the software but they are not responsible for any more than that. If you want to suggest something or see the source code, please contact me. The source code is published under the GNU General Public License Version 2.0. Additional permission is not required for the use of this software. There are no restrictive use or distribution restrictions, but proprietary software must be clearly marked as such. Please direct all support, questions or comments to the following e-mail: promashconverter@gmail.com File sizes will vary but the average size of a converted file will be 2 to 3 times the size of the original file. Each character in the converted file will represent a primitive. *If you need to manually convert any of these files to the new format, you will need to use the Converter Tool (go to the download section below) and specify the following file format:.txt,promash If the file does not open in the converter, it may be because the file is password protected. If the file opens, but some or all of the data is missing or the characters are garbled, it is probably a password protected file. Adding a Recipe: Starting with version 1.0 the user is able to enter recipes or import them from a file. Each recipe has an identifier and a name. Making Changes: Any changes the user makes to a recipe are made by selecting a primitive and making a change to that primitive. Selecting a primitive will automatically add that primitive to the end of a provided string. Examples: * Water "A"
