On-site measurement of frequency shifts in an interferometer with dispersive waves. The on-site detection of waveguide dispersion effects in an interferometer used as a wavemeter is proposed. The key features of the setup, in which the interferometer is based on a Michelson-type configuration, are: (a) the generation of dispersive waves in one arm of the interferometer at the expense of periodic coupling to the optical modes of the waveguide; (b) the measurement of the frequency shifts of the fundamental and harmonic modes of the interferometer resulting from the dispersive waves. The experimental procedure is first carried out to evaluate the achievable resolution of the frequency shifts measurement and then applied to the observation of dispersive effects

of the waveguide on the operation of the interferometer.
