My husband and I were recently blessed with a new son. This time it was a little different, as we also had our daughter in the midst of our pregnancy and labor. All three children are home now, and our little ball of joy is very busy playing all day long. It's always so much fun to watch her with her brother, hearing their laughs and watching their spirit of mischief. She is a wonderful and wonderful girl. Today I found the best way to share this with you. This video is of our toddler (I call her that but she's only 2 years old) trying to do exactly what she does every day...put her two siblings in the bathtub and fill it up with water. Her oldest is wading in and her baby is climbing in and out of her hands, as she wants to reach out to wash away the dirt that she picked up that day. It's so precious and I love watching her with her kids and enjoying all that she is. I thank God for blessing us with a great family and the best time of our lives.BJP and Sena too on same page for strong Mumbai, Patna Prime Minister Narendra Modi and Shiv Sena on Tuesday jointly said that Mumbai and Patna have the potential to be developed as a major economic hub. During an interaction with journalists, the PM and Shiv Sena chief Uddhav Thackeray said that economic activities are growing and Mumbai is playing an important role in India's national economic outlook. Both of them said the focus of the city is on the development of key industries including pharmaceuticals, chemicals, dairy, food processing and automobiles. "You have seen the growth of these industries and this was discussed between both the parties," the Sena leader said. He said Uddhav Thackeray suggested to the PM that a policy should be drawn up for the development of Mumbai. He said the Centre will look at the feasibility of developing the national and international airport at Dabolim. Both parties are of the same opinion about the problems related to Parsik tunnel, Mundhwa road, rain problems, Sagar River problems, Petrapole flyover and the Jejuri-Mankhurd rail line. Modi said that his government has given an additional Rs 15,000 crore for development of the Mumbai Port and East West Corridor. He said the Sena leader has been the only party to

What's New in the?

This invention pertains generally to desiccants which absorb moisture from a closed system and, more particularly, to desiccants which absorb moisture from the air flowing through a fuselage of an aircraft. When an aircraft is in flight, any moisture in the air surrounding the aircraft can condense on the outer surface of the aircraft. This moisture can be sucked into the internal working spaces of the aircraft, such as the engine, fuel, and air conditioning system. Condensed moisture in the areas in which the moisture is eventually expelled by the aircraft degrades the engine, air conditioning system, fuel system, and other components. Consequently, aircraft manufacturers attempt to prevent moisture from being expelled from the aircraft. Some aircraft provide moisture adsorption materials which prevent the expelled moisture from being expelled into the environment. Moisture adsorption materials are effective when the moisture is expelled from the aircraft during a non-flight situation. However, adsorption materials are ineffective in preventing the expelled moisture from being expelled into the environment during a flight situation. This is because adsorption material only adsorbs moisture which has already condensed on the outer surface of the aircraft. It does not prevent moisture from being expelled into the environment when the aircraft is on the ground. Therefore, there exists a need for a method and apparatus for absorbing moisture from the air flowing through an aircraft during a flight situation. The method and apparatus should prevent the moisture from being expelled into the environment. In particular, the method and apparatus should absorb moisture while the aircraft is on the ground and prevent the absorbed moisture from being expelled into the environment during a flight situation. One form of this invention is a method of absorbing moisture from an air flow in an aircraft having at least one fuselage. The method includes the steps of mixing the moisture from the air flow into a moisture adsorption material and transmitting the moisture from the moisture adsorption material into the at least one fuselage. The air flow enters the moisture adsorption material at a selected time prior to the moisture being transmitted into the fuselage. Another form of this invention is a method of absorbing moisture from an air flow in an aircraft having at least one fuselage. The method includes the steps of mixing the moisture from the air flow into a moisture adsorption material; and transmitting the moisture from the moisture adsorption material into the at least one fuselage. The air flow enters the moisture adsorption material at a selected time prior to the moisture being transmitted into the fuselage. The air flow
